The needle wont stay in place. Do I need to replace the needle bar clamp. They should be able to supply manual for you to use. These can usually be downloaded at no charge. Any ideas With modern machines, its usually to the rear, away from you, but with older machines there was more variation. The most common reason the needle wont pick up the bobbin thread is because the flat side of the needle is facing the wrong way for that machine. Hope this helps! Robbie Or, click on google and enter the search terms. There are a lot of places to get service manuals. Consews are free. You may have to pay a few buck from other places but they arent expensive. The stitch looks ok. I have a Consew 226r1 that runs and works very well, except for the fact that I cannot change the stitch length. I own the manual and the parts manual but following the directions does not work. <http://posetili.ru/userfiles/98-explorer-manual-transfer-case.xml>

When I depress the left hand button on the bed plate and turn the wheel towards me the button with drop down and at that point when I try to turn the wheel to change the stitch length the clutch will disengage. When I depress the right hand button the clutch will reengage but the stitch length will not have changed. Help!! Answer questions, earn points and help others. Before you can troubleshoot other problems you will need to correct the timing. If you have a service manual not the owners manual then follow the instructions for aligning the timing. Some of these manuals can be downloaded for free. Do not power up the machine. By hand rotate the needle down with the head laying on its back. With a flashlight watch the needle come through the hole to determine what it is hitting. Ive seen in severe abuse cases that the needle shaft is bent and the needle hits the bobbin case, instead of just coming down next to it. Use a plyer to carefully bend the shaft back to its original position. Consew 226R1 is an excellent machine. Good Luck! Might take a couple of times and be sure to tighten the 3 set screws well when you get it right. They are under the machine, so you have to loosen the belt and lay it on its side. Cant remember where I downloaded the manual last year, but on page 13 it shows the instructions. The photos are bad, so watch carefully. Try consew.com and download 206rb5 manual. Not easy to do, use a flashlight and follow exactly and it will work. I did it the first time and I am not a guy and not a mechanic. HS With modern machines, its usually to the rear, away from you, but with older machines there was more variation. The most common reason the needle wont pick up the bobbin thread is because the flat side of the needle is facing the wrong way for that machine. Hope this helps! Robbie If they were sewing with a light thread on the machine the tension on the bobbin is probably set pretty tight loosen it a little at a

time, turning the screw counter

clockwise.<http://adamlegal.com/userfiles/98-explorer-service-manual.xml>

You might need to check your top tension also if it is showing a knot on the bottom. The bottom is too tight or the top is too loose. I'm working on Push and hold the button then turn the main pulley backwards it should stop and then turn it forwards and the ball bearing should drop in place. Push and hold the button then turn the main pulley backwards it should stop and then turn it forwards and the ball bearing should drop in place. If the needle can be positioned to the right, you may be able to use a regular presser foot. After checking all other reasons for the thread to break it might just be the wrong twist on the thread. Sounds silly but after hours of trying everything else I felt even worse that it was just the wrong thread. The reverse button on your machine should have a spring loaded return. If the spring is in place, and doesn't appear stretched, try using machine oil. If the machine hasn't been serviced in a while, or used a lot recently, the knob may need to go in and out. After oiling the machine, push the knob in and pop it back out. If nothing else is wrong, it should loosen up and move freely. Took it all apart to get it out of the basement, into my car, and up the ladder into my attic, now it's all put back together, oiled and adjusted and working perfectly. Yes, I'd say you got a good deal if you were able to get it sewing perfectly. Post a pic if you can. I found this link, might be of some use Paste as plain text instead Display as a link instead Clear editor Upload or insert images from URL. I'm completely new to sewing machines well, except for really cheap home machines and am not the most mechanically inclined so please be patient with me.

I spoke on the phone with Bob from Toledo Sewing Machines a bit today, who I bought a servo motor off, but I didn't want to bug him too much so I'm hoping some of you out there could give me a hand. Any help or suggestions whatsoever would be hugely appreciated. Thanks. By that, I mean, I have to tug on the thread right after the first post it threads through to give it slack, then pull from where it exits the needle. There doesn't seem to be any excessive tension anywhere, it just seems to be a cumulative effect. This leads me to wonder if I'm threading it wrong, which by reading the manual and looking at all the comparative pictures and youtube videos I can find, it seems I'm doing it right. I do see that there's a metal plate on the back that pushes against a spring to disengage the threads, but I don't see any mechanism that would push the plate to disengage. Hmm. I am very likely screwing something up somewhere so let me know if you see something fishy. Thank you! And fix that thread cup on the stand. They should both be horizontal with spools in place. You seem to have daisy wired it in and out. Does the lifter now separate the disks Push the tensioner assembly inward and tighten the set screw. If not, see if the retainer plate can be forced inward in the middle area. You must have some rod protruding out the back in order to have the disks separate. See if any parts are bent out of shape or loose. The parts are definitely under one thousand dollars. And fix that thread cup on the stand. They should both be horizontal with spools in place. Still pretty hard to pull though. Is that just the nature of the thicker thread. The cup stands seemed wrong to me. ha. Will definitely fix it. You seem to have daisy wired it in and out. Am currently trying it your way. Does the lifter now separate the disks Just a small amount so I didn't notice before. It could probably push it out a little further. As for loosening the bobbin tension.

I can't figure out for the life of me how to do this from what the manual describes. Does it matter which one The picture didn't make it on your post. Can anyone tell me which way the bobbins supposed to go in I'm completely new to sewing machines well, except for really cheap home machines and am not the most mechanically inclined so please be patient with me. I haven't seen one like that in a long time. This is the rod that pushes the tension release lever whenever we lift the feet by hand lever or knee lifter. This way, we can remove the work from the machine easily, when the take up lever is at its highest point. I seriously appreciate your guys' time and help. So moving on with some more complete newbie questions. Should I be hitting any other spots other than the spots market with red and the felt pad I haven't seen one like that in a long time.

This is the rod that pushes the tension release lever whenever we lift the feet by hand lever or knee lifter. This way, we can remove the work from the machine easily, when the take up lever is at its highest point. The manual I have must be the same one hobageeba has. It instructs you to turn the screw near the center of the spring. I have removed the bobbin and do not see anything that resembles a spring. I realize this thread is over a year old, but any help would be appreciated. Thanks. Been sewing for years on my Consew 225 bought used, great machine without the tension release working just pulled the thread at top to get the slack I needed. What a dumb discovery on my part, thanks to all of you on this forum. All of you are the greatest, again thank you.
